KProxy Agent can be used to decrypt the flow data that is sent to Kentik for further analysis. The KProxy agent gets encrypted data from the proxy server, decrypts it, then sends it to Kentik. The proxy server should be the URL used in step . Kentik's KProxy client then decrypted the flow data received from the proxy server. How to configure proxy setup using Kentik. User needs to configure proxy settings using Kentik. If the user has not configured the proxy setup. Program details Description This module is a proxy agent that listens for and forwards requests to the proxy server. The proxy server may have different port numbers. The proxy server should have a protocol (such as HTTP or HTTPS) that can be encrypted or secured in other ways. The proxy should be either a Web server or a network device. The proxy server should not have any built-in traffic filtering or monitoring. It runs just like i want it to, but when i want to save it in the same folder it doesnt recognize the path and always creates something like this: (part of the message): Is the destination path specified relative to the source path? or absolute? Haven't been able to find a solution for this... A: There is 2 ways: The server name is always the same but Windows ID changes, for example a game is running on a another desktop, or copy/move on another drive. The server name is dynamic, and is always the same but there is a networking/internet issue. What you have, is probably the second problem. Try to connect to the server/server IP address, and if this works, then the problem is either a networking one, or an issue with the server (most likely the last).
